

# Permutation & combination

## 01 Fundamental Principles of - Counting

### (1) Multiplication Principle

If an operation can be performed in 'm' different way, following which a second operation can be performed in 'n' different ways, then the two operations in succession can be performed in  $m \times n$  ways. This can be extended to any finite number of operations

### (2) Addition Principle

If an operation can be performed in 'm' different ways & another operation, which is independent of the first operation, can be performed in 'n' different ways, then either of the two operations can be performed in  $(m + n)$  ways. This can be extended to any finite number of mutually exclusive operations.

## 02 Permutation

Each of the different arrangements which can be made by taking some or all of a number of things is called permutations.  
Factorial notation:  $n! = n(n-1)(n-2) \dots 3 \cdot 2 \cdot 1$   
 $n! = n(n-1)!$   $0! = 1! = 1$   
 $2n! = 2n \times n!$   $[1, 3, 5, 7, \dots, (2n-1)]$   
Factorials of negative integers are not defined.

## 03 Important results

01

Number of permutations of  $n$  different things, taking  $r$  at a time is denoted by  ${}^n P_r$  or  $P(n, r)$ .

$${}^n P_r = \frac{n!}{(n-r)!} = n(n-1)(n-2) \dots (n-r+1)$$

Number of permutations of  $n$  different things taken all at a time  $= {}^n P_n = n!$

$${}^n P_0 = 1, {}^n P_1 = n, {}^n P_n = n! \quad {}^n P_r = n({}^{n-1} P_{r-1}) = n(n-1)(n-2) \dots ({}^{n-2} P_{r-2}) \quad {}^{n-1} P_r = (n-r){}^{n-1} P_{r-1}$$
$$P_n = n! \quad P_r = {}^{n-1} P_r + r {}^{n-1} P_{r-1}$$

02

The number of permutation of  $n$  things taken all at a time,  $p$  are alike of one kind,  $q$  are alike of second kind  $r$  are alike of a third kind and  $n=p+q+r$ ;  $\frac{n!}{p!q!r!}$

03

The number of permutations of  $n$  different things taken  $r$  at a time when each thing may be repeated any number of times is  $n^r$ .

04

Number of permutations of  $n$  different things taken  $r$  at a time when a particular thing is to be always included in each arrangement, is  $r {}^{n-1} P_{r-1}$ .  
Number of permutations of  $n$  different things, taken  $r$  at a time, when  $p$  particular things is to be always included in each arrangement, is  $p! (r - (p - 1)) {}^{n-p} P_{r-p}$

05

Number of permutation of  $n$  different things taken  $r$  at a time, when a particular thing is never taken in each arrangement is  ${}^{n-1} P_r$ .

06

Number of permutations of  $n$  different things, taken all at a time, when  $m$  specified things always come together is  $m! \times (n - m + 1)!$

07

Number of permutations of  $n$  different things, taken all at a time, when  $m$  specified things never come together is  $n! - m! \times (n - m + 1)!$

## 04 Circular Permutations

**Arrangement round a circular table:** Number of circular permutations of  $n$  different things taken all at a time is  $(n-1)!$ , if clockwise & anticlockwise orders are taken as different.

**Arrangement of beads around a circular necklace:** Number of circular permutations of  $n$  different things taken all at a time is  $\frac{1}{2}(n-1)!$  if clockwise & anticlockwise orders are taken as not different

Number of circular permutations of  $n$  different things taken  $r$  at a time is-

(i)  $\frac{{}^n P_r}{r}$ , when anti clockwise & clockwise orders are taken as different. (ii)  $\frac{{}^n P_r}{2r}$ , when anticlockwise & clockwise orders are not different.

## 05 Combination

each of the different selections made by taking some or all at a time, irrespective of their arrangements, is called a combination.

The number of all combinations of  $n$  objects taken  $r$  at a time is denoted by  $c(n, r)$  or  ${}^n C_r$  or  $\binom{n}{r}$

$${}^n C_r = \frac{n!}{r!(n-r)!} \quad {}^n C_r = \frac{n(n-1)(n-2) \dots (n-r+1)}{1.2.3 \dots r} \quad {}^n C_n = {}^n C_0 = 1 \quad {}^n C_r = \frac{{}^n P_r}{r!}$$

## 06 Number of Combinations without Repetition

The number of combination (selections or groups) that can be formed from  $n$  different objects taken  $r$  ( $0 \leq r \leq n$ ) at a time is  ${}^n C_r = \frac{n!}{r!(n-r)!}$

•  ${}^n C_r$  is a natural number •  ${}^n C_0 = {}^n C_n = 1, {}^n C_1 = n$  •  ${}^n C_r = {}^n C_{n-r}$  •  ${}^n C_r + {}^n C_{r-1} = {}^{n+1} C_r$  •  ${}^n C_x = {}^n C_y \Leftrightarrow x = y$  or  $x + y = n$  •  $n \cdot {}^{n-1} C_{r-1} = (n-r+1) {}^n C_{r-1}$

• If  $n$  is even, then the greatest value of  ${}^n C_r$  is  ${}^n C_{n/2}$  • If  $n$  is odd, then the greatest value of  ${}^n C_r$  is  $\frac{{}^n C_{n+1}}{2}$  or  $\frac{{}^n C_{n-1}}{2}$  •  ${}^n C_r = \frac{n}{r} \cdot {}^{n-1} C_{r-1}$

$$\bullet \frac{{}^nC_r}{{}^nC_{r-1}} = \frac{n-r+1}{r} \quad \bullet {}^nC_0 + {}^nC_1 + {}^nC_2 + \dots + {}^nC_n = 2^n \quad \bullet {}^nC_0 + {}^nC_2 + {}^nC_4 + \dots = {}^nC_1 + {}^nC_3 + {}^nC_5 + \dots = 2^{n-1} \quad \bullet 2^{n+1}C_0 + 2^{n+1}C_1 + 2^{n+1}C_2 + \dots + 2^{n+1}C_n = 2^{2n}$$

$$\bullet {}^nC_n + {}^{n+1}C_n + {}^{n+2}C_n + {}^{n+3}C_n + \dots + {}^{2n-1}C_n = 2^n C_{n+1}$$

07

## Total number of divisors of a given natural number

The number of factors of a given natural number greater than 1 we can write as,  $N = P_1^{\alpha_1} P_2^{\alpha_2} P_3^{\alpha_3} \dots P_n^{\alpha_n}$  where  $p_1, p_2, \dots, p_n$  are distinct prime numbers and  $\alpha_1, \alpha_2, \dots, \alpha_n$  are non-negative integers.  $(\alpha_1 + 1)(\alpha_2 + 1) \dots (\alpha_n + 1)$  ways. Sum of all the divisors of  $n$  is given by  $\left(\frac{p_1^{\alpha_1+1}-1}{p_1-1}\right) \cdot \left(\frac{p_2^{\alpha_2+1}-1}{p_2-1}\right) \cdot \left(\frac{p_3^{\alpha_3+1}-1}{p_3-1}\right) \dots \left(\frac{p_n^{\alpha_n+1}-1}{p_n-1}\right)$

08

## Derangements

Any change in the existing order of things is called a derangement. If 'n' things are arranged in a row, the number of ways in which they can be deranged so that none of them occupies its

original place is  $n! \left(1 - \frac{1}{1!} + \frac{1}{2!} - \frac{1}{3!} + \dots + (-1)^n \frac{1}{n!}\right) = n! \sum_{r=0}^n (-1)^r \frac{1}{r!}$  And it is denoted by  $D(n)$ .

09

## Multinomial Theorem

Let  $x_1, x_2, \dots, x_m$  be integers. Then number of solutions to the equation  $x_1 + x_2 + \dots + x_m = n$  ... (i)

subject to the conditions ... (ii)

$a_1 \leq x_1 \leq b_1, a_2 \leq x_2 \leq b_2, \dots, a_m \leq x_m \leq b_m$  is equal to the coefficient of  $x^n$  in

$(x^{a_1} + x^{a_1+1} + \dots + x^{b_1})(x^{a_2} + x^{a_2+1} + \dots + x^{b_2}) \dots (x^{a_m} + x^{a_m+1} + \dots + x^{b_m}) \dots$  (iii)

This is because the number of ways in which sum of  $m$  integers in (i) subject to given conditions (ii) equals  $n$  is the same as the number of times  $x^n$  comes in (iii).

10

## Distribution

(1)

Number of ways of distribution of  $n$  distinct balls in  $r$  distinct boxes when order is considered

$= n! {}^{n-1}C_{r-1}$ , if blank (empty) boxes are not allowed. And it is:

$= n! {}^{n+r-1}C_{r-1}$ , if blank (empty) boxes are allowed.

(2)

Number of ways of distribution of  $n$  identical balls into  $r$  distinct boxes  $= {}^{n-1}C_{r-1}$ , if blank

(empty) boxes are not allowed. And it is:

$= {}^{n+r-1}C_{r-1}$ , if blank (empty) boxes are allowed.

(3)

Number of ways of distribution of  $n$  distinct balls into  $r$  distinct boxes when order is not considered  $= r^n$ , if blank (empty) boxes are allowed, And it is:

$= r^n - {}^rC_1 (r-1)^n + {}^rC_2 (r-2)^n - {}^rC_3 (r-3)^n + \dots + (-1)^{r-1} {}^rC_{r-1} 1^n$  if blank (empty) boxes are not allowed.

(4)

The number of combinations of  $n$  objects of which  $p$  are identical taken  $r$  at a time is  $= {}^{n-p}C_r + {}^{n-p}C_{r-1} + \dots + {}^{n-p}C_0$  if  $r \leq p$ .

(5)

The coefficient of  $x^r$  in the expansion of  $(1-x)^{-n}$   $= {}^{n+r-1}C_r$

11

## Multinomial Theorem

If there are  $n_1$  objects of one kind,  $n_2$  objects of second kind and so on  $n_k$  objects of  $k$ th kind, then the number of ways of choosing  $r$  objects out of these objects is  $=$  coeff of  $x^r$  in  $(1+x+x^2+\dots+x^{n_1})(1+x+x^2+\dots+x^{n_2}) \dots (1+x+x^2+\dots+x^{n_k})$ .

1

2

If one object of each kind is to be included in selection of (1), then the number of ways of choosing  $r$  objects is:  $=$  coeff of  $x^{r-1}$  in  $(x+x^2+\dots+x^{n_1})(x+x^2+\dots+x^{n_2}) \dots (x+x^2+\dots+x^{n_k})$

3

The number of possible arrangements permutations of  $p$  objects out of  $n_1$  objects of kind 1,  $n_2$  of kind 2 and so on is  $= p!$  times the coefficient of  $x^p$  in the expansion

$$\left(1+x+\frac{x^2}{2!}+\dots+\frac{x^{n_1}}{n_1!}\right) \dots \left(1+x+\frac{x^2}{2!}+\dots+\frac{x^{n_k}}{n_k!}\right)$$
