

# Work, Power & Energy

## WORK DONE BY CONSTANT FORCE

$$W = \vec{F} \cdot \vec{S}$$

## Work Done by Multiple Forces

$$W = [\Sigma \vec{F}] \cdot \vec{S}$$

$$W = \vec{F}_1 \cdot \vec{S} + \vec{F}_2 \cdot \vec{S} + \vec{F}_3 \cdot \vec{S} + \dots (\because \Sigma \vec{F} = \vec{F}_1 + \vec{F}_2 + \vec{F}_3 + \dots)$$

$$\text{or } W = W_1 + W_2 + W_3 + \dots$$

## Work Done by Variable Force

$$W = \int dW = \int \vec{F} \cdot d\vec{s}$$

❖ Area under the force and displacement curve gives work done.

## RELATION BETWEEN MOMENTUM AND KINETIC ENERGY

$$K = \frac{p^2}{2m} \text{ and } p = \sqrt{2mK}; p = \text{linear momentum}$$

## Potential Energy

$$\int_{U_1}^{U_2} dU = - \int_{r_1}^{r_2} \vec{F} \cdot d\vec{r}$$

$$\text{i.e., } U_f - U_i = - \int_r \vec{F} \cdot d\vec{r} = -W_{\text{Conservative}}$$

## Conservative Force

$$\vec{F} = -\frac{dU}{dr} \hat{r}, \quad \vec{F} = -\frac{\partial U}{\partial x} \hat{i} - \frac{\partial U}{\partial y} \hat{j} - \frac{\partial U}{\partial z} \hat{k}$$

## EQUILIBRIUM CONDITIONS

❖ Stable Equilibrium

$$F(r) = -\frac{\partial U}{\partial r} = 0; \text{ and } \frac{\partial F}{\partial r} < 0; \text{ and } \frac{\partial^2 U}{\partial r^2} > 0$$

❖ Unstable Equilibrium

$$F(r) = -\frac{\partial U}{\partial r} = 0; \text{ therefore } \frac{\partial F}{\partial r} > 0; \text{ and } \frac{\partial^2 U}{\partial r^2} < 0$$

❖ Neutral Equilibrium

$$F(r) = -\frac{\partial U}{\partial r} = 0; \text{ therefore } \frac{\partial F}{\partial r} = 0; \text{ and } \frac{\partial^2 U}{\partial r^2} = 0$$

## WORK-ENERGY THEOREM

$$W_{\text{All}} = \Delta K$$

$$\Rightarrow W_C + W_{\text{NC}} + W_{\text{Ext}} + W_{\text{Pseudo}} = \frac{1}{2}mv_f^2 - \frac{1}{2}mv_i^2$$

## Law of Conservation of Mechanical Energy

If the net external force acting on a system is zero, then the mechanical energy is conserved.

$$K_f + U_f = K_i + U_i$$

## POWER

The average power delivered by an agent is given by

$$P_{\text{avg}} = \frac{W}{t}$$

$$P = \frac{d\vec{F} \cdot \vec{S}}{dt} = \vec{F} \cdot \frac{d\vec{S}}{dt} = \vec{F} \cdot \vec{v}$$

## Circular Motion in Vertical Plane

**A. Condition to complete vertical circle**  $u \geq \sqrt{5gR}$

If  $u = \sqrt{5gR}$  then Tension at C is equal to 0 and tension at A is equal to 6 mg.

$$\text{Velocity at B : } v_B = \sqrt{3gR}$$

$$\text{Velocity at C : } v_C = \sqrt{gR}$$

$$\text{From A to B : } T = mg \cos \theta + \frac{mv^2}{R}$$

From B to C :  $T = \frac{mv^2}{R} - mg \cos \theta$

### B. Condition for pendulum motion (oscillating condition)

$u \leq \sqrt{2gR}$  (in between A to B)

Velocity can be zero but T can never be zero between A and B.

Because T is given by  $T = mg \cos \theta + \frac{mv^2}{R}$ .

## Collisions

- Collision is the interaction between two (or) more particles where exchange of momentum takes place.
- In case of collisions as the impulsive force acting during collision is internal, the total momentum of system always remains conserved.
- If the velocities of the colliding particles are along the same line before and after the collision then the collision is said to be one dimensional collision.
- In a collision, if the motion of colliding particles before and after the collision are not along the initial line of motion, then the collision is said to be oblique collision.
- In an oblique elastic collision, if  $m_1 = m_2$  and  $m_2$  is initially at rest, then after the collision the two masses will move in directions inclined at  $90^\circ$  to each other.

## Coefficient of Restitution

(a)  $e = \frac{\text{relative velocity of separation}}{\text{relative velocity of approach}}$

$\therefore e = \frac{v_2 - v_1}{u_1 - u_2}$

- The value of coefficient of restitution ( $e$ ) is independent of masses and velocities of the colliding bodies. It depends on their materials.
- For a perfectly elastic collision,  $e = 1$   
For a perfectly inelastic collision,  $e = 0$   
For other collisions,  $e$  lies between 0 and 1
- If a body falls from a height 'h' and strikes the level ground with velocity  $V$  in time seconds and rebounds with velocity  $V_1$  upto height  $h_1$  in time  $t_1$  seconds.

The coefficient of restitution is given by

$e = \frac{V_1}{V}$  (or)  $e = \sqrt{\frac{H_1}{H}}$  (or)  $e = \frac{t_1}{t}$

For a perfectly elastic collision,  $H_1 = H$

For a perfectly inelastic collision,  $H_2 = 0$

For other collisions,  $H_1 < H$

For any collision,  $H_1$  cannot be greater than  $h$

- A small metal sphere falls freely from a height 'H' upon a fixed horizontal plane. If  $e$  is the coefficient of restitution, then
  - The height to which it rebounds after n collision is  $H_n = e^{2n} H$
  - The velocity with which it rebounds from the ground after  $n^{\text{th}}$  collision is  $v_n = e^n v$ , where  $v$  is the velocity of the sphere just before first collision.
  - The total distance travelled by it before it stops rebounding is  $d = H \left( \frac{1+e^2}{1-e^2} \right)$
  - The total time taken by it to come to rest is  $T = \sqrt{\frac{2H}{g}} \left( \frac{1+e}{1-e} \right)$
- In one dimensional semi elastic (or) inelastic collisions, linear momentum is conserved but kinetic energy of the system is not conserved.
- In above collisions, there is loss of kinetic energy of the system in the form of heat, sound, light etc.
- In one dimensional semi elastic collision relative velocity of separation  $= e \times$  relative velocity of approach i.e.,  $v_2 - v_1 = e(u_1 - u_2)$

## Inelastic Collisions

- (a) Formulas for final velocities in case of one dimensional semi elastic collision are

$$v_1 = \left( \frac{m_1 - em_2}{m_1 + m_2} \right) u_2 + \left( \frac{1 + e}{m_1 + m_2} \right) m_2 u_2$$

$$v_2 = \left( \frac{m_2 - em_1}{m_1 + m_2} \right) u_2 + \left( \frac{1 + e}{m_1 + m_2} \right) m_1 u_1$$

- (b) Loss in Kinetic energy of the system in one dimensional semi elastic collision is  $\Delta E_k = \frac{1}{2} \left[ \frac{m_1 m_2}{m_1 + m_2} \right] [1 - e^2] [u_2 - u_1]^2$
- (c) In one dimensional perfectly inelastic collision the two particles stick together after the collision and move with common velocity.

- (d) The formula for common velocity of compound body after perfectly inelastic collision is  $\vec{v} = \frac{m_1 \vec{u}_1 + m_2 \vec{u}_2}{m_1 + m_2}$

- (e) The loss of kinetic energy in a perfectly inelastic collision ( $e = 0$ ) is given by  $\Delta E_k = \frac{1}{2} \left[ \frac{m_1 m_2}{m_1 + m_2} \right] [u_1 - u_2]^2$

- (f) In a perfectly inelastic collision, the ratio of loss of energy of the system and its initial energy, if  $u_2$  is zero, is given by  $\frac{\Delta E_k}{E_1} = \frac{m_2}{m_1 + m_2}$

- (g) In a perfectly inelastic collision, the ratio of final energy to initial energy, of the system, if  $u_2$  is zero, is given by  $\frac{E_k}{E_1} = \frac{m_1}{m_1 + m_2} \Rightarrow E_k < E_1$
