

TEMPERATURE SCALE

$$\frac{C}{5} = \frac{F-32}{9} = \frac{K-273}{5} \quad (\text{celcius-fahrenheit-kelvin conversion})$$

any scale conversion formula

Reading on any scale - lower fixed point

Upper fixed point - lower fixed point = constant

LINEAR THERMAL EXPANSION

$$1. \Delta l = \alpha l \Delta \theta \quad \text{heat} \rightarrow l' = l + \Delta l$$

$$2. l' = l(1 + \alpha \Delta \theta)$$

$$3. \alpha = \frac{\Delta l}{l \Delta \theta} \rightarrow \text{unit} \rightarrow /^{\circ}\text{C or } /^{\circ}\text{K, dimension} - \text{K}^{-1}$$

Whatever be the change in temperature, if the difference in length remains constant, then

$$l_1 \alpha_1 = l_2 \alpha_2$$

APPLICATIONS OF LINEAR EXPANSION

Pendulum clock

Fact \rightarrow When temperature increases, time period increases, clock runs slow

\rightarrow When temperature decreases, time period decreases, clock runs fast

1) Loss of time in any given time interval t ,

$$\Delta t = \frac{1}{2} \alpha \Delta \theta t$$

2) Time lost by clock in a day

$$\Delta t = \frac{1}{2} \alpha \Delta \theta t = \frac{1}{2} \alpha \Delta \theta 86400 = 43200 \alpha \Delta \theta$$

Thermal Stress in a rigidly fixed rod

Thermal Stress $= Y \alpha \Delta \theta$

Thermal Force $= Y A \alpha \Delta \theta$

Y - Young's Modulus

α - coefficient of linear expansion

$\Delta \theta$ - temperature change

A - Area of rod

ERROR IN SCALE READING DUE TO EXPANSION OR CONTRACTION

Result: At $\theta' > \theta$ True value $>$ Scale reading

At $\theta' < \theta$ True value $<$ Scale reading

$$\text{True value} = \text{Scale reading} (1 + \alpha \Delta \theta)$$

BIMETALLIC STRIP

$\alpha_{\text{Cu}} > \alpha_{\text{Fe}} \rightarrow$ So when temperature increases $\rightarrow \Delta l$ of Cu $>$ Δl of Fe \rightarrow strip with higher value of α will be on convex side

EXPANSION OF CAVITY

Area of hole increases. Body expands on heating. Expansion of area of body is independent of shape and size of hole

SUPERFICIAL/AREAL EXPANSION

$$1. \Delta A = A \beta \Delta \theta$$

$$2. A' = A(1 + \beta \Delta \theta)$$

$$3. \beta = \frac{\Delta A}{A \Delta \theta} \rightarrow \text{unit} \rightarrow /^{\circ}\text{C or } /^{\circ}\text{K, dimension} - [\text{K}^{-1}]$$

$$4. \beta = 2\alpha$$

CUBICAL EXPANSION/VOLUME EXPANSION

$$1. \Delta V = V \gamma \Delta \theta \quad \gamma = \text{coefficient of volumetric expansion}$$

$$2. V' = V(1 + \gamma \Delta \theta)$$

$$3. \gamma = \frac{\Delta V}{V \Delta \theta} \rightarrow \text{unit} \rightarrow /^{\circ}\text{C or } /^{\circ}\text{K}$$

$$k, \text{ dimension} - [\text{K}^{-1}]$$

$$4. \gamma = 3\alpha$$

$$\alpha : \beta : \gamma = 1 : 2 : 3$$

Variation of density with temperature

$$\text{Density} \propto \frac{1}{\text{Volume}}$$

$$V' = V(1 + \gamma \Delta \theta)$$

$$\text{then } \rho' = \rho(1 - \gamma \Delta \theta)$$

ANOMALOUS EXPANSION OF WATER

1. Water has maximum density at 4°C (minimum volume)

2. On heating, $0^{\circ}\text{C} \rightarrow 4^{\circ}\text{C}$, water contracts
 $4^{\circ}\text{C} \rightarrow$ above, water expands

REAL AND APPARENT EXPANSION OF LIQUID

- Apparent expansion of liquid \rightarrow (Real expansion of liquid - expansion of solid in which liquid is contained)
- Apparent change in volume

$$\Delta V_{\text{apparent}} = V_0 \gamma_{\text{apparent}} \Delta \theta$$

$$\Rightarrow \Delta V_{\text{apparent}} = V_0 (\gamma_l - \gamma_s) \Delta \theta$$

$$\Rightarrow \Delta V_{\text{apparent}} = V_0 (\gamma_l - 3\alpha_s) \Delta \theta$$

$$\Rightarrow \gamma_{\text{apparent}} = \gamma_l - 3\alpha_s$$

γ_l - Real expansion of liquid

α_s - coefficient of linear expansion of solid

CALORIMETRY

$$1 \text{ calorie} = 4.2 \text{ J}$$

Heat Supplied (ΔQ)

change in temperature of body

$$1. \Delta Q = ms \Delta T$$

s - specific heat capacity

$$\text{SI unit} - \frac{\text{Joule}}{\text{kg Kelvin}} \rightarrow \text{J kg}^{-1} \text{K}^{-1}$$

$$2. s_{\text{water}} = 1 \frac{\text{cal}}{\text{g}^{\circ}\text{C}} = 4.2 \frac{\text{J}}{\text{g}^{\circ}\text{C}} = 4200 \frac{\text{J}}{\text{kg}^{\circ}\text{C}}$$

$$s_{\text{ice}} = \frac{1}{2} \frac{\text{cal}}{\text{g}^{\circ}\text{C}} = 2.1 \frac{\text{J}}{\text{g}^{\circ}\text{C}} = 2100 \frac{\text{J}}{\text{kg}^{\circ}\text{C}}$$

change of state of body

Melting

$$\Delta Q = mL_f$$

L_f - Latent heat of fusion

Boiling

$$\Delta Q = mL_v$$

L_v - Latent heat of vaporization

$$\bullet L_f = L_{\text{ice}} = 80 \frac{\text{cal}}{\text{g}} = 80 \times 4.2 \frac{\text{J}}{\text{g}} = 80 \times 4200 \frac{\text{J}}{\text{kg}}$$

$$\bullet L_v = L_{\text{steam}} = 540 \frac{\text{cal}}{\text{g}} = 540 \times 4.2 \frac{\text{J}}{\text{g}} = 540 \times 4200 \frac{\text{J}}{\text{kg}}$$

Heat supplied at constant rate
Graph & equation

$$\frac{Q}{t} = \frac{msT_1}{t_1} = \frac{mL_f}{t_2 - t_1} = \frac{ms(T_2 - T_1)}{t_3 - t_2} = \frac{mL_v}{t_4 - t_3}$$

if specific heat is variable

$$S = f(T) \quad T_1 \rightarrow T_2 \quad \Delta Q = \int_{T_1}^{T_2} msdT$$

HEAT CAPACITY

Heat capacity = mass \times specific heat capacity

$$\text{Unit} = \frac{\text{cal}}{^{\circ}\text{C}}, \text{ SI unit is } \frac{\text{J}}{\text{K}}$$

WATER EQUIVALENT

The mass of water that will absorb or lose the same quantity of heat as a given substance will do for same change in temperature

$$m_w s_w = m_b s_b \quad w = \text{water} \quad b = \text{body}$$

PRINCIPLE OF CALORIMETRY

Heat lost by the hotter bodies = Heat gained by colder bodies

$$Q_3 = Q_1 + Q_2$$

Final equilibrium temperature,

$$T_{\text{eq}} = \frac{m_1 s_1 T_1 + m_2 s_2 T_2 + m_3 s_3 T_3}{m_1 s_1 + m_2 s_2 + m_3 s_3} = \frac{\sum msT}{\sum ms}$$

Facts:
Calorimeter - A device for measurement of amount of heat involved in a process.

ICE-WATER SYSTEM

Problem solving methodology

1. m_1 gram ice [$- \theta_1^{\circ}\text{C}$] mixed with m_2 gram water [$\theta_2^{\circ}\text{C}$]

2. Convert $- \theta_1^{\circ}\text{C}$ ice $\rightarrow 0^{\circ}\text{C}$ ice

$$\Delta Q_1 = m_1 s_{\text{ice}} \theta_1$$

3. Convert 0°C ice $\rightarrow 0^{\circ}\text{C}$ water

$$\Delta Q_2 = m_1 L_f$$

4. Convert $\theta_2^{\circ}\text{C}$ water $\rightarrow 0^{\circ}\text{C}$ water

$$\Delta Q_3 = m_2 s_{\text{water}} \theta_2$$

$$\text{check } \Delta Q_3 > \Delta Q_1 + \Delta Q_2 \text{ or } \Delta Q_1 + \Delta Q_2$$

$$\Delta Q_3 > \Delta Q_1 + \Delta Q_2$$

1. Whole ice melts into water

2. Additional heat [$\Delta Q' = \Delta Q_3 - (\Delta Q_1 + \Delta Q_2)$] is used to increase the temperature of system from 0°C

3. Final temperature can be found out by

$$\Delta Q' = M_{\text{total}} s_{\text{water}} T$$

$$\Delta Q_3 < \Delta Q_1 + \Delta Q_2$$

1. Only m' g of ice melts

2. Mass of ice melted can be found by [m = mass of ice melted]
 $m L_f = Q$

3. Final temperature is 0°C

CONVERSION OF MECHANICAL ENERGY TO HEAT ENERGY

1. Potential energy to heat energy

$$\Delta U = mgh \xrightarrow{\text{converts to heat}} \Delta Q = m' L_f \quad [m' = \text{mass of substance melted/vaporized}]$$

When equating, multiply ΔQ with 4200 J if L_f is in cal/g

$$\text{i.e., } mgh = m' L_f \times 4200$$

2. Kinetic energy to Heat energy

$$K.E = \frac{1}{2} mv^2 \xrightarrow{\text{converts to heat}} \Delta Q = m' L_f \quad [m' = \text{mass of substance melted/vaporized}]$$

If L_f is in $\frac{\text{calorie}}{\text{g}}$

then

$$\frac{1}{2} mv^2 = m' L_f \times 4200$$

HEAT TRANSFER

1. Conduction:

Heat flows from hot end to cold end.

Medium is necessary.

Slow process.

$$\frac{dQ}{dt} = K A \frac{d\theta}{dx}$$

$$\text{Unit of 'K'} = \frac{\text{watt}}{\text{metre}^{\circ}\text{C}} \text{ or } \frac{\text{watt}}{\text{metre K}}$$

'K' depends on the nature of material

$$\frac{dQ}{dt} = \text{Rate of flow of heat}$$

A = Area of cross section

$\frac{d\theta}{dx}$ = Temperature gradient

K = coefficient of thermal conductivity

THERMAL PROPERTIES OF MATTER

OHM'S LAW OF CONDUCTION

Electrical Conduction

- 1) current, $I = \frac{dq}{dt}$
- 2) $I = \frac{\Delta V}{R}$ ($\Delta V = V_{\text{high}} - V_{\text{low}}$)
- 3) electrical resistance, $R = \frac{\rho l}{A}$
- 4) $I = \frac{V_1 - V_2}{R} = \frac{(V_1 - V_2)A}{\rho l} = \frac{\sigma A}{l} (V_1 - V_2)$
- 5) Combination of resistors

i) Series Combination

Here 'I' is same in all resistors

ii) Parallel Combination

Here $(V_1 - V_2)$ is same for all resistors

Thermal Conduction

- 1) Heat current, $H = \frac{dQ}{dt}$
- 2) $H = \frac{\theta_1 - \theta_2}{R} = \frac{\Delta \theta}{R}$ ($\theta_1 > \theta_2$)
- 3) Thermal resistance, $R = \frac{l}{KA}$
- 4) $H = \frac{\theta_1 - \theta_2}{R} = \frac{\theta_1 - \theta_2}{(l/KA)} = \frac{KA}{l} (\theta_1 - \theta_2)$
- 5) Combination of conductors

i) Series Combination

Find $R_{eq} = R_1 + R_2 + \dots$ Here, heat current, H is same in all conductors

ii) Parallel Combination

Find $\frac{1}{R_{eq}} = \frac{1}{R_1} + \frac{1}{R_2} + \dots$
from that find K_{eq}
Here, Temp Difference is same for all conductors

CONVECTION

Requires a medium. Actual movement of fluid. Occurs naturally or forced.

Natural convection takes place due to the effect of gravity

Applications:

Sea Breeze
Wind blows from sea to land during day time

Land Breeze
Wind blows from land to sea during night

RADIATION

Absorptive, reflective and Transmittive power

Absorptive power $(a) = \frac{Q_a}{Q} = \frac{\text{Energy absorbed}}{\text{Energy incident}}$

Reflective power $(r) = \frac{Q_r}{Q} = \frac{\text{Energy reflected}}{\text{Energy incident}}$

Transmittive power $(t) = \frac{Q_t}{Q} = \frac{\text{Energy transmitted}}{\text{Energy incident}}$

EMISSIVE POWER/INTENSITY OF THERMAL RADIATION

Emissive power $(E) = \frac{\text{Energy radiated}}{\text{area} \times \text{time}}$ unit $\rightarrow \frac{\text{Watt}}{\text{m}^2}$

Spectral emissive power $(E_\lambda) = \frac{\text{Energy radiated}}{\text{area} \times \text{time} \times \text{wavelength}}$ unit $\rightarrow \frac{\text{Watt}}{\text{m}^3}$

Relation between E & $E_\lambda \Rightarrow E = \int_0^\infty E_\lambda d\lambda$

EMISSIVITY (e)

$e = \frac{\text{Energy radiated by a general body}}{\text{Energy radiated by a black body}}$

value of $e \Rightarrow 0 < e < 1$

If $e = 0$, the body radiates no energy

If $e = 1$, the body is a perfect black body

KIRCHHOFF'S LAW

Ratio of emissive power to absorptive power is same for all surfaces at the same temperature and is equal to the emissive power of a perfectly black body at that temperature.

$$\frac{E_1}{a_1} = \frac{E_2}{a_2} = \dots = E_b$$

STEFAN'S LAW

Emissive power of a black body \propto fourth power of absolute temperature and surface area of the body

$$E = \sigma AT^4 \text{ OR } \frac{\Delta Q}{\Delta t} = \sigma AT^4$$

$\sigma \rightarrow$ Stefan's constant $\frac{\Delta Q}{\Delta t} \rightarrow$ Radiant power

value of $\sigma \rightarrow 5.67 \times 10^{-8} \text{ W m}^{-2} \text{ K}^{-4}$

Dimension $\rightarrow [\sigma] = \text{MT}^{-3} \text{ K}^{-4}$

For ordinary body $E = e\sigma T^4$

$$\frac{\Delta Q}{\Delta t} = eA\sigma T^4 \quad e = \text{emissivity}$$

In the presence of a surrounding. ($T_0 =$ Surrounding temperature)
For black body,

$$E = \sigma A(T^4 - T_0^4)$$

In the presence of a surrounding. ($T_0 =$ Surrounding temperature)
For general body,

$$E = e\sigma A(T^4 - T_0^4)$$

WIEN'S LAW

Wien's displacement law

$$\lambda_m \propto \frac{1}{T}$$

$$\lambda_m T = b$$

$b =$ Wien's constant

$$\text{Hence } \frac{A_1}{A_2} = \left[\frac{T_1}{T_2} \right]^4$$

$$b = 2.89 \times 10^{-3} \text{ mK}$$

$\lambda_{m1} T_1 = \lambda_{m2} T_2$
Area under the graph, $A = \int_0^\infty E_\lambda d\lambda = E = \sigma T^4$ [Dimensions] = [b] = [LK]

"As the temperature of the body increases, the wavelength at which the spectral intensity (E_λ) is maximum shift towards left."

NEWTON'S LAW OF COOLING

Rate of cooling \propto excess temperature of the body over the surrounding.

$$\frac{-dT}{dt} \propto (T - T_0)$$

$T =$ Temperature of body
 $T_0 =$ Temperature of surrounding
 $T_i =$ initial temperature of the body

$$\frac{T - T_0}{T_i - T_0} = e^{-kt}$$

THERMAL PROPERTIES OF MATTER

TEMPERATURE OF INTERMEDIATE JUNCTION
